44.61%

On-Time Delivery Rate vs. 90% Target

Revenue vs. On-Time Delivery

Key Insights

Revenue is healthy and stable - \$262.5M over three years with a 60.4% gross margin - but on-time delivery has never moved from ~44.6%, month after month, for all 36 months. This isn't a bad quarter; it's a persistent operational gap sitting underneath solid financials. Digging into the cause: it's not the routes (profitability varies widely, but reliability doesn't track with it), not the drivers (even top performers barely clear the fleet average), and not specific facilities (the worst-detention docks aren't meaningfully less reliable than the network average). The consistency of the problem across every dimension points to a systemic scheduling or dispatch issue - not a handful of weak links that can be individually fixed.

Recommendation

Since the delivery problem isn't traceable to any single route, driver, or facility, it likely originates in how delivery windows are promised or scheduled - worth auditing the dispatch/booking process itself (e.g., are commitments realistic given typical transit and detention times?) rather than pursuing driver retraining or route renegotiation alone, which the data suggests would have limited impact.

Total Fuel Cost and Avg Price per Gallon by YearMonth

Key Insights

Fuel price dropped in sharp annual steps (\$4.20 - \$3.85 - \$3.65), not a gradual decline; savings are price-driven, not efficiency-driven, since gallons purchased stayed flat. Similarly, top-revenue drivers show no on-time advantage: even the best individual OTD rate (47.7%) barely clears the fleet average, ruling out driver performance as the delivery problem's cause.

Top Drivers

Full Name	Sum of years_experience	Total Trips	Avg MPG	On-Time Delivery Rate	Total Driver Revenue

Total Maintenance Cost by maintenance_type

Recommendation

Since driver performance shows no correlation with reliability, retraining initiatives should be deprioritized in favor of process-level fixes.

Preventable Incidents

37.65%

On-Time Delivery Rate vs. 90% Target

Key Insights

On-time delivery has sat flat at ~44.6% for all 36 months; not seasonal, not improving, just consistently broken. Equipment Damage incidents are the least frequent safety incident type but carry the highest claims cost, suggesting infrequent but severe failures rather than routine wear. Combined with the Commercial and Fleet Ops findings - no route, driver, or truck stands out as the cause of the delivery problem - this points to a systemic scheduling/dispatch issue rather than any single fixable weak point.

On-Time Delivery Trend

Facilities with Highest Detention

Facility Label	city	Avg Detention Minutes	On-Time Delivery Rate
Indianapolis Warehouse (Indianapolis)	Indianapolis	108.77	42.82%
Phoenix Distribution Center (Phoenix)	Phoenix	108.27	43.36%
Denver Distribution Center (Denver)	Denver	109.22	43.43%

Total		108.60	44.19%

Safety Incidents by Type

Recommendation

With over a third of safety incidents flagged preventable, a targeted driver coaching program focused on Equipment Damage prevention specifically could reduce the highest-cost incident category
